

Lathyrus ms2: Selection on reaction norms - Extraction of RN parameters with lms

Contents

Reaction norm of FFD to mean daily temperature April, using the subset of data with plants with 4 or more years of data

Plot of the 243 reaction norms

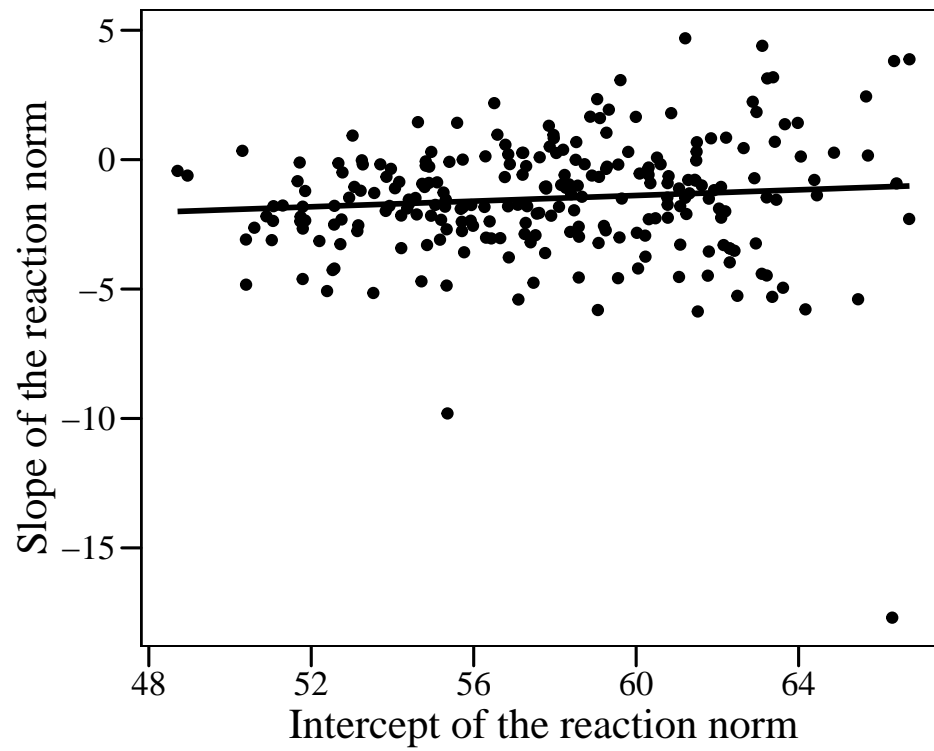

Extraction of parameters for every reaction norm (i.e. for each individual)

```
## # A tibble: 243 x 3
##   id      intercept4 slope4
##   <fct>      <dbl>  <dbl>
## 1 new_10      52.2 -3.14
## 2 new_100     51.8 -4.61
## 3 new_101     56.4 -3.04
## 4 new_102     51.8 -2.66
## 5 new_103     55.3 -1.82
## 6 new_104     58.2 -0.592
## 7 new_106     55.7 -2.76
## 8 new_107     57.3 -2.87
## 9 new_108     57.3 -1.80
## 10 new_109    54.8 -1.06
## # ... with 233 more rows
```

Correlation among intercepts and slopes:

```
## [1] 0.09457023
```

Correlation here is much lower than using BLUPs - WHY??? Problems with random effect of year in mixed models below?

Check that parameters are correct graphically by plotting some reaction norms
